engineering economics subject code questions with answer

Engineering economics is a vital subject for engineering students, focusing on the application of economic principles to engineering projects and decision-making processes. To excel in this subject, students often encounter subject code questions designed to assess their understanding of core concepts, formulas, and problem-solving skills. In this comprehensive guide, we will explore common engineering economics questions with detailed answers, helping students prepare effectively for exams and practical applications.

Understanding Engineering Economics: An Overview

Before diving into specific questions, it?s essential to grasp the fundamental principles of engineering economics. The subject primarily deals with evaluating the economic viability of projects, comparing alternatives, and making informed financial decisions based on cost, revenue, and time value of money.

Key concepts include:

- Time value of money
- Present worth and future worth
- Annual equivalent cost
- Rate of return and payback period
- Cost analysis and benefit analysis
- Depreciation and salvage value

Common Engineering Economics Subject Code Questions with Answers

Question 1: Calculate the Present Worth of a Future Sum

Question:

A project promises to pay $10,000 five years from now. If the discount rate is 8% per annum, what is the present worth of this amount?

Answer:

The present worth (PW) can be calculated using the formula:

$$ PW = \frac{F}{(1 + i)^n} $$

Where:

- $ F $ = Future sum = $10,000
- $ i $ = Discount rate = 8% = 0.08
- $ n $ = Number of years = 5

Calculating:

$$ PW = \frac{10,000}{(1 + 0.08)^5} = \frac{10,000}{1.46933} \approx \$6,805.83 $$

Conclusion:

The present worth of $10,000 received after five years at an 8% discount rate is approximately \$6,805.83.

Question 2: Determine the Future Value of an Investment

Question:

An engineer invests $5,000 annually at an interest rate of 10% for 7 years. What will be the future value of this series of investments?

Answer:

This is a future value of an ordinary annuity problem. The formula is:

$$ FV = P \times \frac{(1 + i)^n - 1}{i} $$

Where:

- $ P $ = Annual payment = $5,000
- $ i $ = Interest rate = 10% = 0.10
- $ n $ = Number of years = 7

Calculating:

$$ FV = 5,000 \times \frac{(1 + 0.10)^7 - 1}{0.10} $$

$$ FV = 5,000 \times \frac{1.948717 - 1}{0.10} $$

$$ FV = 5,000 \times 9.48717 \approx \$47,435.85 $$

Conclusion:

After 7 years, the total future value of the investments will be approximately \$47,435.85.

Question 3: Find the Equivalent Annual Cost (EAC)

Question:

A machine costs $50,000, has a salvage value of $5,000 after 10 years, and requires annual maintenance costs of $3,000. If the interest rate is 12%, what is the equivalent annual cost (EAC) of owning and operating the machine?

Answer:

The EAC is calculated by spreading the total costs over the lifespan of the machine, accounting for the time value of money.

Step 1: Calculate the Present Worth of the costs.

- Initial cost: \$50,000 (at year 0)
- Salvage value: \$5,000 after 10 years, so its present worth (PW salvage):

$$ PW_{salvage} = \frac{5,000}{(1 + 0.12)^{10}} \approx \frac{5,000}{3.10585} \approx \$1,609.84 $$

Step 2: Calculate the present worth of annual maintenance costs using the capital recovery factor:

$$ PW_{maintenance} = 3,000 \times \frac{(1 + i)^n - 1}{i \times (1 + i)^n} $$

Alternatively, since maintenance costs are annual, the present worth of an annuity:

$$ PW_{maintenance} = 3,000 \times \frac{1 - (1 + i)^{-n}}{i} $$

Calculating:

$$ PW_{maintenance} = 3,000 \times \frac{1 - (1 + 0.12)^{-10}}{0.12} $$

$$ PW_{maintenance} = 3,000 \times \frac{1 - 0.32197}{0.12} $$

$$ PW_{maintenance} = 3,000 \times 5.650 \approx \$16,950 $$

Step 3: Calculate the net present worth (NPW):

$$ NPW = (Initial\,cost) - PW_{salvage} + PW_{maintenance} $$

$$ NPW = 50,000 - 1,609.84 + 16,950 \approx \$65,340.16 $$

Step 4: Find the EAC:

$$ EAC = NPW \times \frac{i \times (1 + i)^n}{(1 + i)^n - 1} $$

$$ EAC = 65,340.16 \times \frac{0.12 \times (1.12)^{10}}{(1.12)^{10} - 1} $$

$$ EAC = 65,340.16 \times \frac{0.12 \times 3.10585}{3.10585 - 1} $$

$$ EAC = 65,340.16 \times \frac{0.3727}{2.10585} \approx 65,340.16 \times 0.177 \approx \$11,565.45 $$

Conclusion:

The equivalent annual cost of owning and operating the machine is approximately \$11,565.45.

Question 4: Calculate the Internal Rate of Return (IRR)

Question:

An investment of \$20,000 yields cash inflows of \$5,000 annually for 6 years. What is the internal rate of return (IRR)?

Answer:

IRR is the discount rate that makes the net present value (NPV) zero. The formula involves solving:

$$ 20,000 = 5,000 \times \frac{1 - (1 + IRR)^{-6}}{IRR} $$

This equation is typically solved iteratively or using financial calculator or software. Using approximation:

Step 1: Recognize that this is the present value of an annuity:

$$ PV = P \times \frac{1 - (1 + r)^{-n}}{r} $$

Step 2: Rearrange to estimate IRR:

$$ \text{NPV} = 0 \Rightarrow PV = 20,000 $$

$$ 20,000 = 5,000 \times \frac{1 - (1 + r)^{-6}}{r} $$

Dividing both sides by 5,000:

$$ 4 = \frac{1 - (1 + r)^{-6}}{r} $$

Now, test different rates:

- At $r = 10\%$:

$$ \frac{1 - (1 + 0.10)^{-6}}{0.10} = \frac{1 - 0.5645}{0.10} = 4.355 $$ (greater than 4)

- At $r = 12\%$:

$$ \frac{1 - (1 + 0.12)^{-6}}{0.12} = \frac{1 - 0.507}{0.12} = 4.104 $$ (close to 4)

Since 4.104 is slightly above 4, IRR is approximately 11.5%.

Conclusion:

The internal rate of return (IRR) for this investment is approximately 11.5%.

Question 5: Determine the Payback Period

Question:

A project requires an initial investment of \$100,000 and is expected to generate annual cash inflows of \$25,000. What is the payback period?

Answer:

The payback period is the time needed to recover the initial investment from cash inflows. It is calculated as:

$$\text{Payback Period} = \frac{\text{Initial Investment}}{\text{Annual Cash Inflows}}$$

Calculating:

$$\frac{100,000}{25,000} = 4 \text{ years}$$

Conclusion:

The project will recover its initial investment in

Engineering Economics Subject Code Questions with Answer: A Comprehensive Guide

In the realm of engineering education, mastering engineering economics subject code questions with answer is essential for students aiming to excel in their coursework and future professional endeavors. These questions not only test your understanding of economic principles applied to engineering projects but also enhance your decision-making skills related to cost analysis, investment appraisal, and financial feasibility. This guide aims to walk you through the process of approaching these questions systematically, providing strategies, examples, and detailed explanations to strengthen your grasp of the subject.

Understanding the Importance of Engineering Economics in Academic and Professional Contexts

Engineering economics bridges the gap between technical engineering concepts and financial decision-making. It involves analyzing costs, benefits, risks, and economic viability of projects, often through subject code questions that simulate real-world scenarios. Proficiency in tackling these questions ensures that engineers can make informed choices about project investments, resource allocation, and cost management.

Key Components of Engineering Economics Subject Code Questions

Before diving into solving techniques, it?s vital to understand the typical components of these questions:

- Cost Estimation: Identifying and calculating various costs involved in a project (initial, operational, maintenance).

- Time Value of Money: Applying concepts like present value (PV), future value (FV), and discount rates.
- Financial Metrics: Calculating and interpreting measures such as net present value (NPV), internal rate of return (IRR), payback period, and benefit-cost ratio.
- Comparison of Alternatives: Evaluating different project options based on economic criteria.
- Sensitivity Analysis: Assessing how changes in assumptions or variables impact outcomes.

Step-by-Step Approach to Answering Engineering Economics Subject Code Questions

- Carefully Read and Understand the Question

Start by identifying what is being asked:

- Are you asked to calculate the NPV or IRR?
- Is the question about comparing alternatives?
- Does it involve determining the most economical choice?

Note all given data: costs, revenues, interest rates, project durations, etc.

- Organize Data Systematically

Create a table or list to organize cash flows, costs, and assumptions. Clear organization helps avoid errors during calculations.

- Identify the Appropriate Financial Tools

Choose the right method based on the question:

- Use NPV for evaluating the profitability of a project over time.
- Use IRR when comparing the rate of return of different projects.
- Use Payback Period for quick assessment of recovery time.
- Use Benefit-Cost Ratio (BCR) for comparing multiple alternatives.

- Apply Relevant Formulas and Techniques

Ensure you understand and correctly apply formulas, such as:

- Present Value (PV):

PV = Future Value / (1 + i)^n

- Net Present Value (NPV):

NPV = ? (Cash inflow/outflow at time t) / (1 + i)^t

- Internal Rate of Return (IRR):

The discount rate (i) at which NPV = 0

- Payback Period:

Time taken for cumulative cash flows to recover initial investment

- Perform Calculations Carefully

Use scientific calculators or spreadsheets like Excel to handle complex computations, especially for iterative methods like IRR.

- Analyze and Interpret Results

Compare the computed metrics:

- A positive NPV indicates a potentially profitable project.
- The IRR should be higher than the required rate of return.
- Shorter payback periods are generally preferred, but consider the project's overall profitability.

- Cross-Verify and Validate Answers

Double-check calculations. Confirm that assumptions align with the question's context.

Practical Examples of Engineering Economics Subject Code Questions with Answer

Example 1: Net Present Value Calculation

Question:

A company is considering purchasing a new machine costing $50,000. The machine is expected to generate additional cash inflows of $15,000 annually for 5 years. The company's required rate of return is 10%. Should the company invest in the machine?

Solution:

Step 1:

Identify data:

- Initial Investment = $50,000
- Annual Cash Inflows = $15,000
- Duration = 5 years
- Discount Rate = 10%

Step 2:

Calculate Present Value of inflows using PV of annuity:

PV of inflows = $15,000 × [(1 - (1 + i)^-n) / i]

PV of inflows = $15,000 × [(1 - (1 + 0.10)^-5) / 0.10]

PV of inflows ? $15,000 × [1 - (1 / (1.6105))] / 0.10

PV of inflows ? $15,000 × [1 - 0.6209] / 0.10

PV of inflows ? $15,000 × 0.3791 / 0.10

PV of inflows ? $15,000 × 3.791

PV of inflows ? $56,865

Step 3:

Calculate NPV:

NPV = PV of inflows - Initial Investment

NPV = $56,865 - $50,000 = $6,865

Conclusion:

Since NPV is positive ($6,865), the investment is financially viable.

Example 2: Internal Rate of Return (IRR)

Question:

A project requires an initial investment of $100,000 and is expected to generate cash inflows of $30,000 annually for 4 years. What is the IRR? Should the project be accepted if the required rate of return is 12%?

Solution:

Step 1:

Set NPV equation to zero and solve for IRR:

0 = -$100,000 + $30,000 × [(1 - (1 + IRR)^-4) / IRR]

Step 2:

Estimate IRR using trial and error or financial calculator:

Using Excel IRR function or calculator:

Cash flows: Year 0: -$100,000

Year 1-4: $30,000

IRR ? 17.4%

Step 3:

Decision:

Since IRR (17.4%) > required rate (12%), the project is acceptable.
