What is Physical Science?

Definition of Physical Science

Physical science is a branch of natural science that studies non-living systems, focusing on the properties and interactions of matter and energy. It combines elements of physics and chemistry to explain how the universe operates.

Main Branches of Physical Science

- **Physics:** The study of matter, energy, motion, and forces.
- **Chemistry:** The study of substances, their properties, and how they interact and change.

Key Concepts in 7th Grade Physical Science

1. Matter and Its Properties

Matter is anything that has mass and takes up space. It exists in different states and has various properties.

States of Matter

- Solid
- Liquid

- Gas

Properties of Matter

- Color
- Hardness
- Melting Point
- Boiling Point
- Density

2. Atoms and Elements

Atoms are the smallest units of matter that retain the properties of an element.

Basic Structure of an Atom

- Protons (positive charge)
- Neutrons (no charge)
- Electrons (negative charge)

Elements

- Pure substances made of only one type of atom.
- The periodic table organizes all known elements.

3. Mixtures and Solutions

- Mixtures consist of two or more substances physically combined.
- Solutions are a type of mixture where one substance dissolves in another (e.g., salt in water).

4. Laws of Motion and Force

Inspired by Sir Isaac Newton's work, these laws describe how objects move.

Newton's Three Laws of Motion

- **First Law:** An object at rest stays at rest, and an object in motion stays in motion unless acted upon by an external force.
- **Second Law:** Force equals mass times acceleration ($F=ma$).
- **Third Law:** For every action, there is an equal and opposite reaction.

5. Energy

Energy is the capacity to do work and exists in various forms.

Types of Energy

- Kinetic Energy
- Potential Energy
- Thermal Energy
- Electrical Energy

Conservation of Energy

Energy cannot be created or destroyed; it only changes from one form to another.

6. Simple Machines

Simple machines make work easier and include:

- Lever
- Pulley
- Inclined Plane
- Wheel and Axle
- Wedge
- Screw

Common Practice Questions and Their Answers

1. What are the three states of matter, and how do they differ?

The three states of matter are solids, liquids, and gases. Solids have a fixed shape and volume, with particles tightly packed. Liquids have a fixed volume but take the shape of their container, with particles that are less tightly packed and can slide past each other. Gases have neither fixed shape nor volume; particles are far apart and move freely.

2. How can you identify an element on the periodic table?

Elements are identified by their chemical symbols (e.g., H for hydrogen, O for oxygen). Each element has a unique symbol and atomic number, which indicates the number of protons in its nucleus.

3. Describe Newton's First Law of Motion with an example.

Newton's First Law states that an object will stay at rest or in uniform motion unless acted upon by an external force. For example, a soccer ball remains stationary until kicked or pushed.

4. What is the difference between kinetic and potential energy?

Kinetic energy is the energy of motion (e.g., moving car), while potential energy is stored energy based on position or condition (e.g., water held behind a dam).

5. Name and explain the function of at least two simple machines.

A lever is a rigid bar that pivots around a fulcrum, used to lift heavy objects with less effort. A pulley uses a wheel and a rope to change the direction of force, making lifting easier.
